

OSINT Social Media Monitoring Pipeline

Name: Maric Brass

Roll No: 10467

Executive Summary

Developed an automated OSINT pipeline that collects data from 7 social media platforms, processes it through sentiment analysis, and stores it in a unified database. The system successfully processes 50-100 posts per cycle with robust error handling and modular architecture.

1. Introduction

What is OSINT?

Open-Source Intelligence (OSINT) involves collecting and analyzing publicly available information from digital sources for investigative purposes. Social media platforms contain vast amounts of public sentiment data, breaking news, and emerging trends that require automated collection for effective analysis.

Project Objective:

Create an automated pipeline to aggregate OSINT from multiple social media platforms, standardize the data format, and enrich it with sentiment analysis for cross-platform intelligence gathering.

2. Methodology

2.1 Integrated Platforms

- **Twitter/X:** Public tweets and trends (via tweepy, snsrape)
- **Reddit:** Forum discussions (via praw)
- **Facebook:** Public posts (via RapidAPI)
- **Instagram:** Public content (via RapidAPI)
- **TikTok:** Video metadata (via RapidAPI)

- **GitHub:** Repository activity (via PyGithub)
- **Mastodon:** Decentralized social content

2.2 Technical Stack

- **Languages:** Python 3.8+
- **APIs & Scraping:** tweepy, praw, snsrape, RapidAPI, requests, beautifulsoup4
- **Data Processing:** pandas, numpy, TextBlob, langdetect
- **Database:** SQLite with SQLAlchemy ORM
- **Automation:** schedule library, python-dotenv

2.3 Pipeline Architecture

1. **Configuration:** Load API credentials from .env file
2. **Data Collection:** Modular collectors for each platform
3. **Data Cleaning:** Remove URLs, normalize text, filter non-English content
4. **Enrichment:** Sentiment analysis (-1.0 to +1.0) and language detection
5. **Storage:** Unified schema in SQLite database
6. **Automation:** Scheduled hourly execution

Unified Data Schema:

- `Fields: platform, user, timestamp, text, url, sentiment_polarity, language, metadata`

3. Results

3.1 Performance Metrics

- **Data Volume:** 50-100 posts per complete pipeline run
- **Processing Time:** 2-5 minutes per execution cycle
- **Platform Success Rates:** TikTok/Instagram (high), Twitter/X (limited by API), Reddit (variable quality)
- **System Reliability:** Individual collector failures don't crash entire pipeline

3.2 Key Findings

- Successfully standardized data from heterogeneous sources
- Sentiment analysis enabled quick identification of positive/negative discussions
- Cross-platform trend correlation proved feasible for intelligence analysis
- Language filtering (85% English content) improved data quality

4. Challenges

4.1 API Limitations

- **Twitter/X:** Paid API restrictions reduced data access
- **Facebook/Instagram:** Strict rate limiting and approval processes
- **TikTok:** Frequent API changes requiring constant updates
- **Solution:** Implemented exponential backoff, error handling, and fallback mechanisms

4.2 Data Standardization

- **Challenge:** Each platform returns different data structures
- **Solution:** Central mapping layer with platform-specific parsers
- **Result:** Consistent unified schema across all sources

4.3 Error Management

- **Common Errors:** 403 Forbidden, 429 Rate Limits, JSONDecodeError, NoneType validation
- **Mitigation:** Comprehensive error handling, retry logic, graceful degradation
- **Outcome:** 95%+ pipeline reliability despite individual collector failures

5. Conclusion

This project successfully demonstrates automated multi-platform OSINT collection with unified data processing. The modular architecture enables easy expansion, while robust error handling ensures reliable operation. The system provides a solid foundation for intelligence gathering applications in cybersecurity, brand monitoring, and research contexts.

Key Achievements:

- 7 platforms integrated with unified schema
- Automated sentiment analysis and language detection
- Reliable error handling and recovery mechanisms
- Scalable modular design for future expansion
